**Distributed Software Infrastructure**

# **CORBA /DDS, COMPETING or COMPLEMENTING TECHNOLOGIES ?**

**OMG Real-time and Embedded Systems Workshop**

July 2005

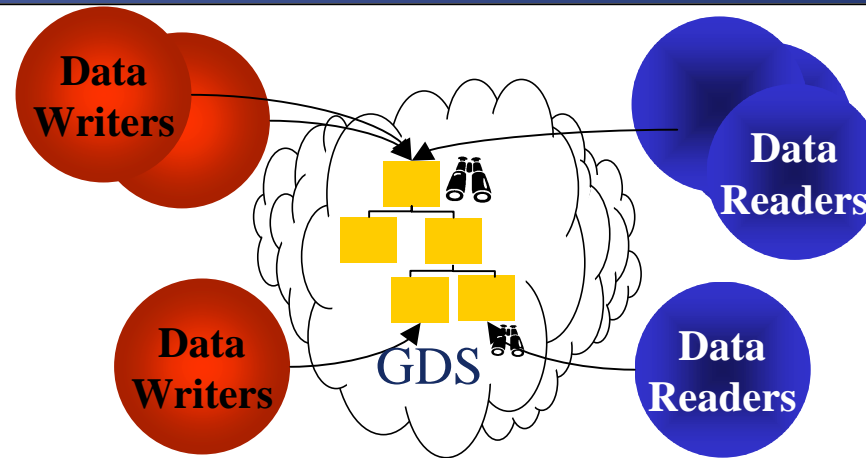

*Ramzi KAROUI*

- ▶ Can I use CORBA to distribute data on the network ?
- ▶ Is the notification service able to provide similar functionalities as DDS?
- ▶ Can I use DDS as a Request Broker ?
- ▶ Can I use CORBA with DDS?
- ▶ Can DDS interwork with CORBA effectively ?
- ▶ When Shall I use CORBA and when shall I use DDS ?

# DDS Genesis

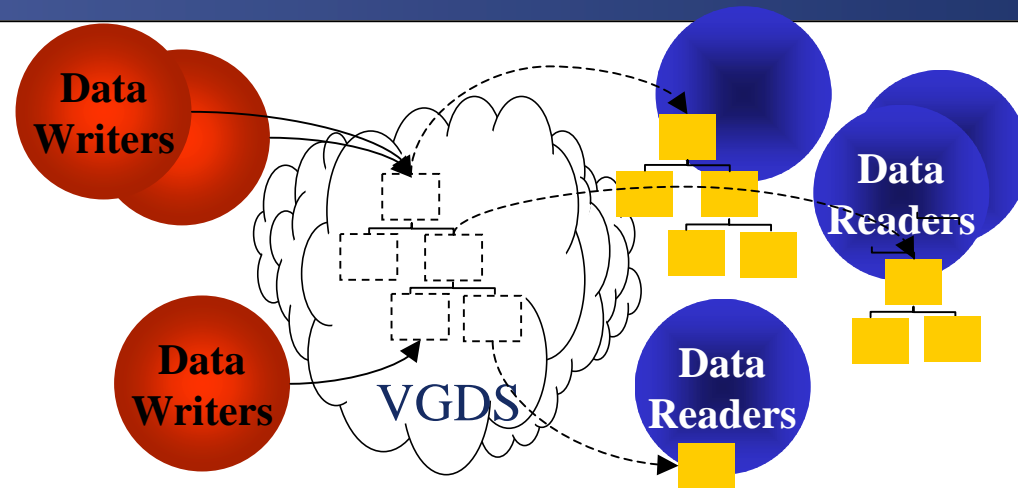

# Data Centric Canonical Models

- ▶ Data writers and Readers accessing to a common Global Data Space (GDS)
  - ▶ GDS can be:
    - ▶ Shared Memory,
    - ▶ Centric or Replicated Databases,
    - ▶ Distributed Databases.
  - ▶ Writers and Readers can **share a unique view of data** or they can have their **own dataview**
- ▶ Having a unique GDS Holder for the whole system leads to
  - ▶ Single point of failure,
  - ▶ Decrease scalability and performance,
- ▶ Distributed DBMSs are heavy and inappropriate for reactive and near realtime systems
  - ▶ Don't offer standard behaviors to synchronize and notify readers on data availability etc ...
  - ▶ Don't offer enough data lifecycle control,
  - ▶ Involves heavy mechanisms to guaranty high level data consistency (distributed transactions, distributed locking protocols etc ...),

# Data Centric Publish and Subscribe middleware

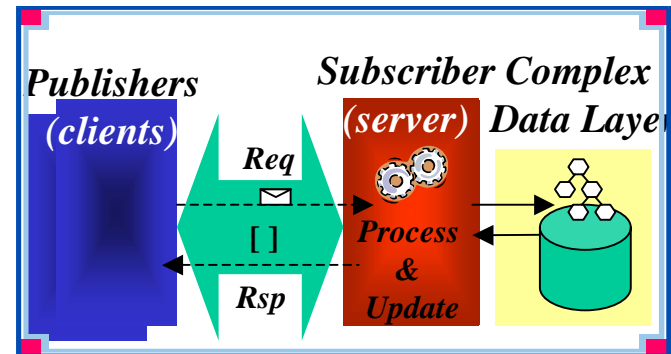

- ▶ Virtual GDS should be managed and maintained by a Data Centric Middleware which is able to split and publish the right dataview, to the right reader at right time.
  - ▶ Data Centric Pub-Sub
    - ▶ Virtual Global Data Space is split in a multitude of data views or topics
    - ▶ DCPS Purpose: QoS Driven Distributed Data management
  - ▶ The Data Centric Middleware must be able to reconstruct the data using the Reader's own native information model
    - ▶ Object Oriented model,
    - ▶ Relational Model, etc ...
    - ▶ Data Local Reconstruction Layer
      - ▶ DLRL Purpose: provide an OO-model to access data as Local Objects
- ▶ **DDS : DCPS + DLRL**

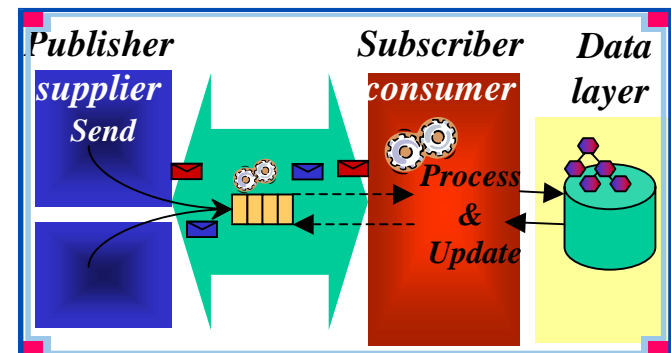

# The Data Distribution Paradigm

## ▶ DDS is used for Information centric rather Service centric applications

- ▶ Focusing on **data** instead of *Processing and Services*
- ▶ Model your information exchange using **high level data Models** instead of exchanging elementary data units (*Messages, Events...*)
- ▶ **Delegate** Information dissemination, processing and management to the Middleware
  - ▶ Specify your **own view on data schema** and let the middleware build it for you !

*Service Oriented Middleware*

*Event/ Messaging Oriented Middleware*

*Information Centric Oriented Middleware*

**PRISMTECH**

**Distributed Software Infrastructure**

# **DDS and CORBA, congruous or incongruous?**

## congruous or incongruous?

- ▶ As an MDA compliant OMG Spec, DDS is CORBA independent but not CORBA-incompatible,
  - ▶ DDS PSM is in CORBA IDL
  - ▶ DCPS data model can be represented with IDL data types and structures
    - ▶ Strcut, Object by Values etc ...
- ▶ CORBA and DDS have more than Common Data Representation and IDL in common

# CORBA and DDS Underlying Concepts

## *Similarities and Differences*

### ▶ DDS Concepts

- ▶ Handle, manage and dispatch complex **data** models.
  - ▶ Portability, language and platform transparency
  - ▶ Platform independent Data-model
  - ▶ Strongly typed interfaces,
  - ▶ Realtime,
  - ▶ QoS Management,
  - ▶ Location Transparency
  - ▶ **Data Integrity Control and Filtering**
  - ▶ **Domain managements**
  - ▶ **Data History**
  - ▶ **Fault tolerance** (implementation dependent)

### ▶ Equivalent CORBA Concepts

- ▶ Handle and manage most of the distributed objects interactions aspects, including objects state (**data**)
  - ▶ **Interoperability**, Portability, language and platform transparency
  - ▶ Platform independent Object model
  - ▶ **Dynamic** and Strongly typed interfaces
  - ▶ Relatime
  - ▶ QoS management
  - ▶ Location Transparency
  - ▶ Specialized Filtering and domain management capabilities applying to event driven communication only
  - ▶ **Security, Transaction, Time, Fault tolerance, Openess** (Interworking with other technologies)

# DDS and CORBA Design Principles, Great Differences in Design

- ▶ DDS more than a Pub/Sub Middleware
  - ▶ *DDS is a **data broker** and a **data manager***
  - ▶ Design principle, the **Integration** of data distribution, data management, and data location functions
  - ▶ Data management functions are defined as profiles
    - ▶ Data LifeCycle,
    - ▶ Data Query,
    - ▶ Local Object Relationship management,
    - ▶ Data Concurrency (ownership),
    - ▶ Data Persistency,
    - ▶ Data (topic) discovery,
    - ▶ Data Dissemination ...
- ▶ CORBA more than a Request Broker
  - ▶ CORBA manage Object states too (**data**)
  - ▶ Design principle, the **Separation** between Object management functions
  - ▶ Object management functions are defined as Common Object Services
    - ▶ LifeCycle CoS,
    - ▶ Query CoS,
    - ▶ Object Relationship CoS,
    - ▶ Concurrency CoS,
    - ▶ Persistent CoS,
    - ▶ Naming/Trading CoSs
    - ▶ Notification, Event and Logging CoSs

# DDS with a CORBA infrastructure ?

# Typed Notification Service

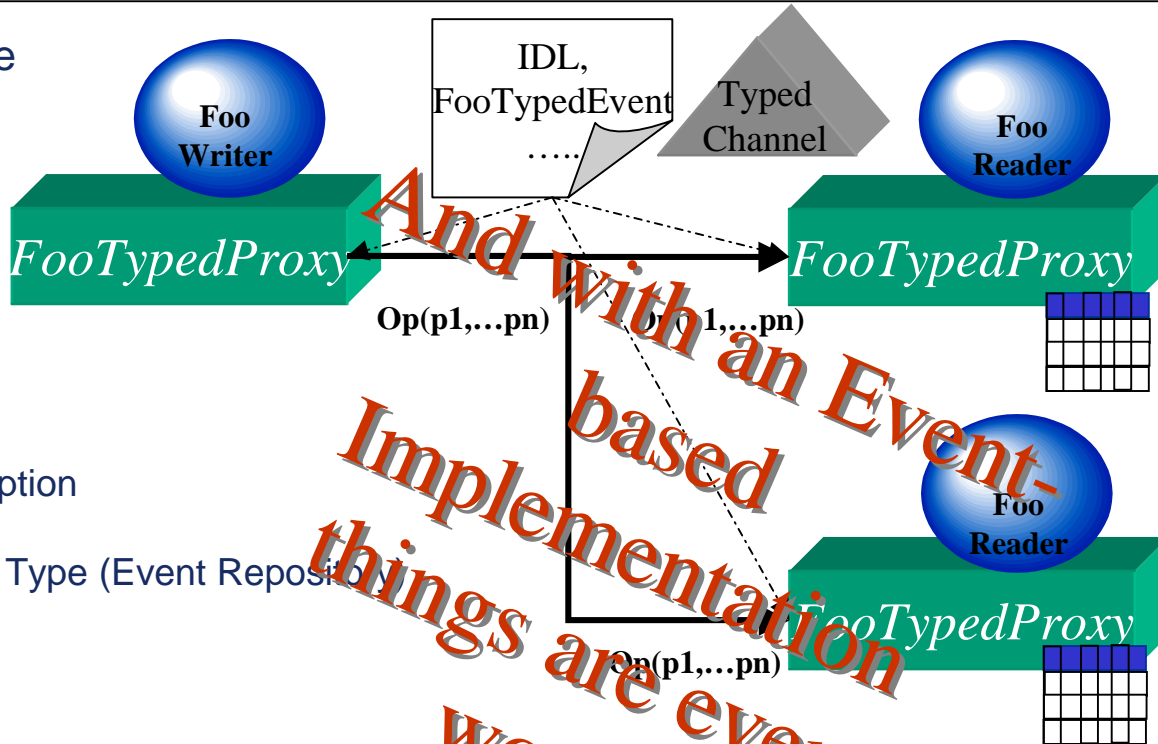

## A Candidate for a DCPS ?

▶ Any attempt should at least reuse Notification concepts

▶ It can use iiopt multicast

▶ What can be done with an NS

- ▶ DDS Typed Data exchange
  - ▶ Typed Events
- ▶ DDS Sharing Subscription
  - ▶ Notification Sharing Subscription
- ▶ DDS Topic discovery
  - ▶ Dynamic Discovery of Event Type (Event Repository)
- ▶ DDS Content subscription
  - ▶ Filtering
  - ▶ The use of SQL is possible
- ▶ DDS Reliability
  - ▶ Event Reliability notification QoS
- ▶ DDS Domain partition
  - ▶ Event Domain management QoSs
- ▶ DDS data deadline
  - ▶ Event deadline, with no guarantee
- ▶ All the other DDS QoS can not be directly mapped to Notification QoS

# Beyond QoSs, What can't be Achieved with Notification

- ▶ Rebuilding of dataObject
  - ▶ should be handled by Application
- ▶ Aggregation of data items
  - ▶ Should be handled by the application
- ▶ Propagation of Atomic data items
  - ▶ Could be done with the help of transaction service,
    - ▶ Could impact performance.
- ▶ Partial modification of a data object
- ▶ Data change state notifications
- ▶ Data ownership
- ▶ Handling of multiple datatypes
  - ▶ Should be handled by the application
- ▶ Realtime propagation
- ▶ Support of the most current data values
  - ▶ Notification does not support the LIFO policy,
- ▶ Dynamic discovery of datatype
  - ▶ Could be done by using a Trader Service
  - ▶ Trader management should be handled by application
- ▶ DataHistory
  - ▶ Could be done with the integration of Query Service
    - ▶ Query management Service should be handled by application

# DDS with CORBA - Conclusions

- ▶ Building full DDS-like architecture with existing CORBA infrastructure and services is **very difficult**
  - ▶ Several basic CoSs (COTS) are not available on market anymore (Query, Persistence, Lifecycle ...)
  - ▶ Application level have to endorse the integration of the CoSs (Notification, Query, LifeCycle, Persistence) to build data-items, coordinate their state and build additional features
  - ▶ No Realtime Typed Notification Service implementation available.
- ▶ *Performance, Fault-tolerance, and high-availability, continues to present a concern*
  - ▶ *No major FT-CORBA COTS available*
  - ▶ *FT-CORBA impact Performance*
  - ▶ *... ROMiop and Miop are not the clear favorites in the race for the definition of a DDS interoperable wire protocol ...*

# Where CORBA Can Complement DDS?

- ▶ Request/Reply transportation
  - ▶ Application will should handle request processing
    - ▶ Use topic keys like RequestID/ReplyID
    - ▶ Correlate Requests with replies
    - ▶ .....
  - ▶ Don't offer an object oriented view of the Server interfaces ...
  - ▶ Synchronous remote invocations are not possible

- ▶ CORBA and DDS are complementary and compatible

**PRISMTECH**

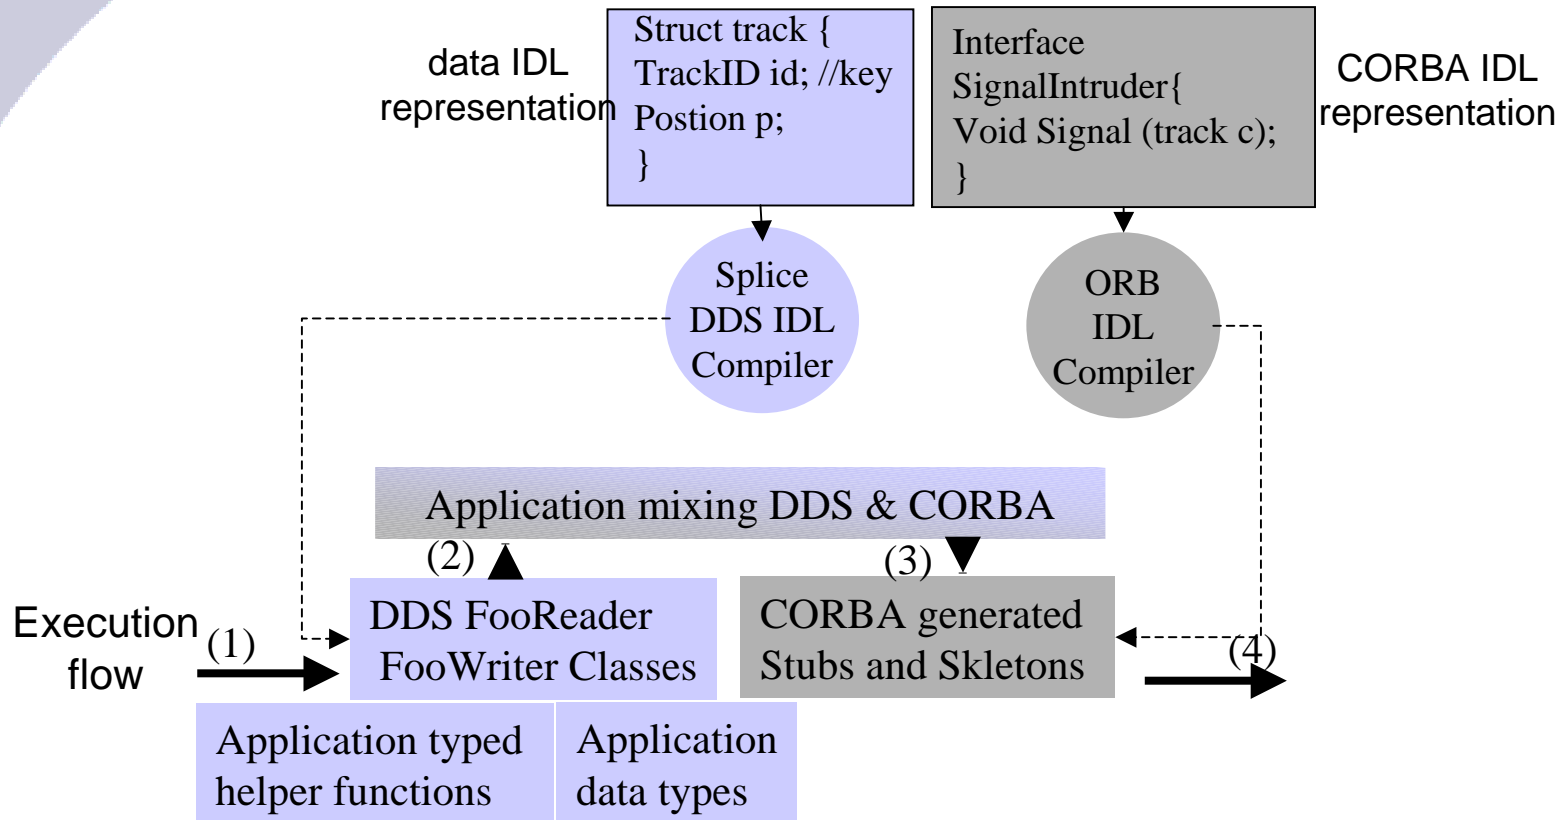

**Distributed Software Infrastructure**

# **DDS CORBA Interworking**

# The Problem to solve

- ▶ Carry DDS datatems to the CORBA world
- ▶ Carry CORBA invocations to the DDS world

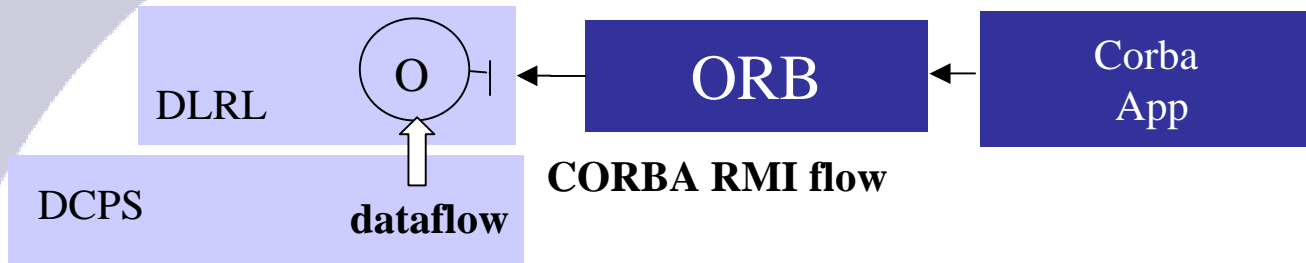

# DCPS CORBA Interworking: Some Work to be Done

*If the CORBA - DCPS interworking is handled by application developers:*

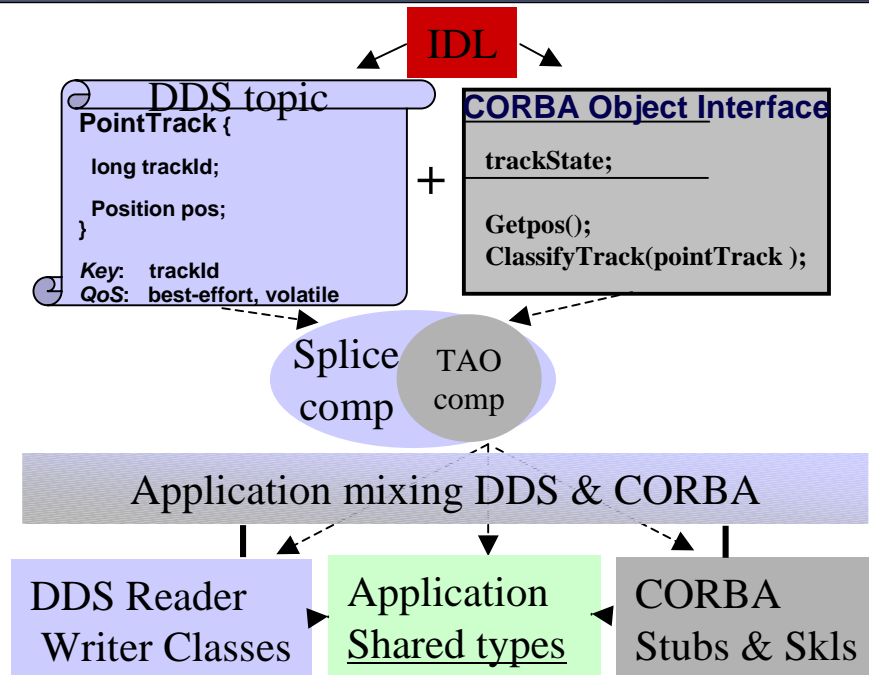

- ▶ From CORBA to DDS
  - ▶ Each CORBA Call need to be converted to a topic
    - ▶ CORBA, op(x1,x2) -> To DDS topic(x1,x2)
      - ▶ Restrictions: Xi could not be OBV nor a Struct
      - ▶ ValueTypes can not be defined at the DCPS level
- ▶ From DDS to CORBA
  - ▶ Data instances are , either mapped to RMI parameters or used to build an Object request (DII)
  - ▶ DDS Typed Interfaces makes the design of Generic bridging technology difficult,
- ▶ First Solution
  - ▶ Half of the Corba-DDS brigde could be made generic easily
  - ▶ Complicates the Application Programming Model and limits the application portability
  - ▶ Error-prone
- ▶ Second Solution
  - ▶ Bridge Code Generation
    - ▶ Using IDL topic description and Corba Object IDL interfaces
- ▶ Third Solution
  - ▶ Interoperability handled at the transport level
  - ▶ Encapsulation of the DDS Message in GIOP
  - ▶ Encapsulation of the GIOP Message in DDS
    - ▶ Main issue: DDS does not provide any common transport protocol, yet .. !!

# DLRL: Toward Smooth Integration Between DDS and CORBA

- ▶ DLRL Objects maps to ValueTypes
- ▶ DLRL does not directly distribute these valuetypes over the network
- ▶ CORBA can distribute valuetypes
  - ▶ DLRL Objects can be passed as arguments to Remote Method Invocation, or
  - ▶ DLRL Object can be wrapped into a CORBA object to make it reachable remotely
  - ▶ A **CORBA-DDS container** could be defined or generated to wrap the DLRL objects

# SPLICE-DDS: an Example of a SMART DDS-CORBA Interworking

## ▶ IDL, a Common definition language:

- ▶ For CORBA-interfaces & DDS topics,
  - ▶ same IDL, name-space, same IDL to native language mapping
  - ▶ Code generation : Typed data generation as well as (typed-)interfaces

## ▶ Seamless Runtime Cooperation

- ▶ Shared types allow direct passing-on of RPC-obtained information into DDS-topics
- ▶ Fully autonomous runtime-systems (no dependency, no real-time influence)

- ▶ **Building full DDS-like architecture with existing CORBA infrastructure is not viable**
    - ▶ Require intensive development and Finalization of Other technologies ...
      - ▶ Realtime notification service, ...
  - ▶ **Building a full CORBA-like architecture with DDS infrastructure is not viable either**
  - ▶ **DDS-CORBA Interworking is well suited for growing demand of data centric and service centric mixed architectures**
    - ▶ Network Centric Warfare, etc ...
  
  - ▶ **DDS is suitable for Tier-2 type of application**
    - Fast Information Access Essential***
      - ▶ Command Execution in CMS
        - ▶ Distribution of Track updates and navigation data to OA components
      - ▶ ATM, Inter-site connection
  - ▶ **CORBA is more suitable for Tier-3**
    - Service Centric Architecture Essential***
      - ▶ Command Control & Support
      - ▶ ATM, Site-2-Site connection
- 
- ▶ **SPLICE-DDS can make DDS-CORBA interworking easier**
  - ▶ Use same name space and IDL for both DCPS-topics and CORBA Object Interfaces
  - ▶ Future development of SPLICE-DLRL would make the integration more natural

- ▶ We are very interested by your feedback on CORBA-DDS interworking
  - ▶ Your requirements,
  - ▶ Your suggestions,
  - ...
- ▶ Downloads and More information on SPLICE-DDS available at [www.prismtech.com](http://www.prismtech.com)
- ▶ Off-line questions can be sent to [ramzi.karoui@prismtech.com](mailto:ramzi.karoui@prismtech.com) and Hans van 't Hag at [hans.vanthag@nl.thalesgroup.com](mailto:hans.vanthag@nl.thalesgroup.com)
- ▶ Much more information to come on SPLICE-DDS with Hans's next presentation
