Nashville, Tennessee, USA**

# Learning Objectives in this Part of the Lesson

---

- Understand how completion stage methods chain dependent actions
- Know how to group these methods
- Single stage methods
- Two stage methods (and)
- Two stage methods (or)
- Apply these methods
- Handle runtime exceptions
  - Sync vs. async exceptions
  - Overview of methods
  - Applying these methods

---

# Examples of Handling Exceptions in Completion Stages

# Examples of Handling Exceptions in Completion Stages

- This example shows three ways to handle exceptions w/completable futures

**CompletableFuture**

```
.supplyAsync(() ->  
    BigFraction.valueOf(100, denominator))
```

```
...
```

*An exception will occur if  
denominator param is 0!*

# Examples of Handling Exceptions in Completion Stages

- This example shows three ways to handle exceptions w/completable futures

**CompletableFuture**

```
.supplyAsync(() ->  
    BigFraction.valueOf(100, denominator))
```

...

**TERMINATED**

*An unhandled exception  
will terminate a program!*

# Examples of Handling Exceptions in Completion Stages

- Using the handle() method to handle exceptional or normal completions

CompletableFuture

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))
    .handle((fraction, ex) -> {
        if (fraction == null)
            return BigFraction.ZERO;
        else
            return fraction.multiply(sBigReducedFraction);
    })
    .thenAccept(fraction ->
        System.out.println(fraction.toMixedString())));
}
```

*Handle outcome of the previous stage (always called, regardless of whether an exception is thrown)*

# Examples of Handling Exceptions in Completion Stages

- Using the handle() method to handle exceptional or normal completions

CompletableFuture

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))
.handle((fraction, ex) -> {
    if (fraction == null)
        return BigFraction.ZERO;
    else
        return fraction.multiply(sBigReducedFraction);
})
.thenAccept(fraction ->
    System.out.println(fraction.toMixedString()));
```

*These values are mutually exclusive*

# Examples of Handling Exceptions in Completion Stages

- Using the handle() method to handle exceptional or normal completions

CompletableFuture

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))

.handle((fraction, ex) -> {
    if (fraction == null)
        return BigFraction.ZERO;
    else
        return fraction.multiply(sBigReducedFraction);
})

.thenAccept(fraction ->
    System.out.println(fraction.toMixedString()));
```

*The exception path converts ("swallows") an exception & returns BigFraction.ZERO*

# Examples of Handling Exceptions in Completion Stages

- Using the handle() method to handle exceptional or normal completions

CompletableFuture

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))

.handle((fraction, ex) -> {
    if (fraction == null)
        return BigFraction.ZERO;
    else
        return fraction.multiply(sBigReducedFraction);
})

.thenAccept(fraction ->
    System.out.println(fraction.toMixedString()));
```

The "normal" path

# Examples of Handling Exceptions in Completion Stages

- Using the handle() method to handle exceptional or normal completions

CompletableFuture

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))

.handle((fraction, ex) -> {
    if (fraction == null)
        return BigFraction.ZERO;
    else
        return fraction.multiply(sBigReducedFraction);
})

.thenAccept(fraction ->
    System.out.println(fraction.toMixedString()));
```

*handle() must return a value (& can thus change the return value)*

# Examples of Handling Exceptions in Completion Stages

- Using the handle() method to handle exceptional or normal completions

`CompletableFuture`

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))

.handle((fraction, ex) -> {
    if (fraction == null)
        return BigFraction.ZERO;
    else
        return fraction.multiply(sBigReducedFraction);
})

.thenAccept(fraction ->
    System.out.println(fraction.toMixedString()));

```

*Display result as a mixed fraction*

# Examples of Handling Exceptions in Completion Stages

- Using the exceptionally() method to handle exceptional or normal completions

`CompletableFuture`

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))

.thenApply(fraction ->
    fraction.multiply(sBigReducedFraction))

.exceptionally(ex -> BigFraction.ZERO)

.thenAccept(fraction ->
    System.out.println(fraction.toMixedString()));
```

# Examples of Handling Exceptions in Completion Stages

- Using the exceptionally() method to handle exceptional or normal completions

`CompletableFuture`

`.supplyAsync(() ->`

`BigFraction.valueOf(100, denominator))`

*An exception occurs if denominator is 0!*

`.thenApply(fraction ->`

`fraction.multiply(sBigReducedFraction))`

`.exceptionally(ex -> BigFraction.ZERO)`

`.thenAccept(fraction ->`

`System.out.println(fraction.toMixedString()));`

# Examples of Handling Exceptions in Completion Stages

- Using the exceptionally() method to handle exceptional or normal completions

**CompletableFuture**

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))

.thenApply(fraction ->
    fraction.multiply(sBigReducedFraction))

.exceptionally(ex -> BigFraction.ZERO)
```

*Handle case where denominator != 0 (skipped if exception is thrown)*

```
.thenAccept(fraction ->
    System.out.println(fraction.toMixedString()));
```

# Examples of Handling Exceptions in Completion Stages

- Using the exceptionally() method to handle exceptional or normal completions

`CompletableFuture`

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))

.thenApply(fraction ->
    fraction.multiply(sBigReducedFraction))

.exceptionally(ex -> BigFraction.ZERO)

.thenAccept(fraction ->
    System.out.println(fraction.toMixedString()));
```

*Handle case where denominator == 0 &  
exception is thrown (otherwise skipped)*

exceptionally() is akin to catch() in a Java try/catch block, i.e., control xfers to it

# Examples of Handling Exceptions in Completion Stages

- Using the exceptionally() method to handle exceptional or normal completions

`CompletableFuture`

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))

.thenApply(fraction ->
    fraction.multiply(sBigReducedFraction))

.exceptionally(ex -> BigFraction.ZERO)

.thenAccept(fraction ->
    System.out.println(fraction.toMixedString()));
```

*Convert ("swallow") an exception to a 0 result*

# Examples of Handling Exceptions in Completion Stages

- Using the exceptionally() method to handle exceptional or normal completions

`CompletableFuture`

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))

.thenApply(fraction ->
    fraction.multiply(sBigReducedFraction))

.exceptionallyAsync(ex -> BigFraction.ZERO)

.thenAccept(fraction ->
    System.out.println(fraction.toMixedString()));
```

*Can be used if exception handling takes a long time*

# Examples of Handling Exceptions in Completion Stages

- Using the exceptionally() method to handle exceptional or normal completions

**CompletableFuture**

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))

.thenApply(fraction ->
    fraction.multiply(sBigReducedFraction))

.exceptionally(ex -> BigFraction.ZERO)

.thenAccept(fraction ->
    System.out.println(fraction.toMixedString()));
```

*Display result as a mixed fraction*

# Examples of Handling Exceptions in Completion Stages

- Using the whenComplete() method to perform a exceptional or normal action

```
CompletableFuture
```

```
.supplyAsync(() ->  
    BigFraction.valueOf(100, denominator))
```

```
.thenApply(fraction ->  
    fraction.multiply(sBigReducedFraction))
```

*Called under both normal & exception conditions*

```
.whenComplete((fraction, ex) -> {  
    if (fraction != null)  
        System.out.println(fraction.toMixedString());  
    else  
        System.out.println(ex.getMessage());  
});
```

# Examples of Handling Exceptions in Completion Stages

- Using the whenComplete() method to perform a exceptional or normal action

```
CompletableFuture
```

```
.supplyAsync(() ->  
    BigFraction.valueOf(100, denominator))
```

```
.thenApply(fraction ->  
    fraction.multiply(sBigReducedFraction))
```

*These values are mutually exclusive*

```
.whenComplete((fraction, ex) -> {  
    if (fraction != null)  
        System.out.println(fraction.toMixedString());  
    else  
        System.out.println(ex.getMessage());  
});
```

# Examples of Handling Exceptions in Completion Stages

- Using the whenComplete() method to perform a exceptional or normal action

```
CompletableFuture
```

```
.supplyAsync(() ->  
    BigFraction.valueOf(100, denominator))
```

```
.thenApply(fraction ->  
    fraction.multiply(sBigReducedFraction))
```

```
.whenComplete((fraction, ex) -> {  
    if (fraction != null)  
        System.out.println(fraction.toMixedString());  
    else  
        System.out.println(ex.getMessage());  
});
```

*Handle the normal case*

# Examples of Handling Exceptions in Completion Stages

- Using the whenComplete() method to perform a exceptional or normal action

```
CompletableFuture
```

```
.supplyAsync(() ->  
    BigFraction.valueOf(100, denominator))  
  
.thenApply(fraction ->  
    fraction.multiply(sBigReducedFraction))  
  
.whenComplete((fraction, ex) -> {  
    if (fraction != null)  
        System.out.println(fraction.toMixedString());  
    else // ex != null  
        System.out.println(ex.getMessage());  
});
```

*Handle the  
exceptional case*

# Examples of Handling Exceptions in Completion Stages

- Using the whenComplete() method to perform a exceptional or normal action

CompletableFuture

```
.supplyAsync(() ->
    BigFraction.valueOf(100, denominator))

.thenApply(fraction ->
    fraction.multiply(sBigReducedFraction))

.whenComplete((fraction,
    if (fraction != null)
        System.out.println(fraction.toMixedString());
    else // ex != null
        System.out.println(ex.getMessage());
}));
```

*whenComplete() is like Java Streams.peek(),  
i.e., it has a side-effect, doesn't change the  
return value, & doesn't swallow the exception*

---

# End of Advanced Java

## CompletableFuture Features:

### Handling Runtime Exceptions (Part 2)
