Nashville, Tennessee, USA

Learning Objectives in this Part of the Lesson

- Part 1 of case study ex3 shows how to use RxJava Observable operators flatMap(), fromArray(), fromIterable(), onErrorReturn(), fromCallable(), collect(), onErrorResumeNext(), reduce(), filter(), subscribeOn(), map(), & Schedulers.computation() to asynchronously create, multiply, & display BigFraction objects, even in the presence of errors

Observable

```
.fromCallable(() ->  
    BigFraction  
        .valueOf(Math.abs  
            (sRAND.nextInt()),  
            denominator))  
  
.subscribeOn  
(Schedulers.computation())  
  
.onErrorReturn(errorHandler)  
  
.map(bf -> bf.multiply  
(sBigReducedFraction)))
```

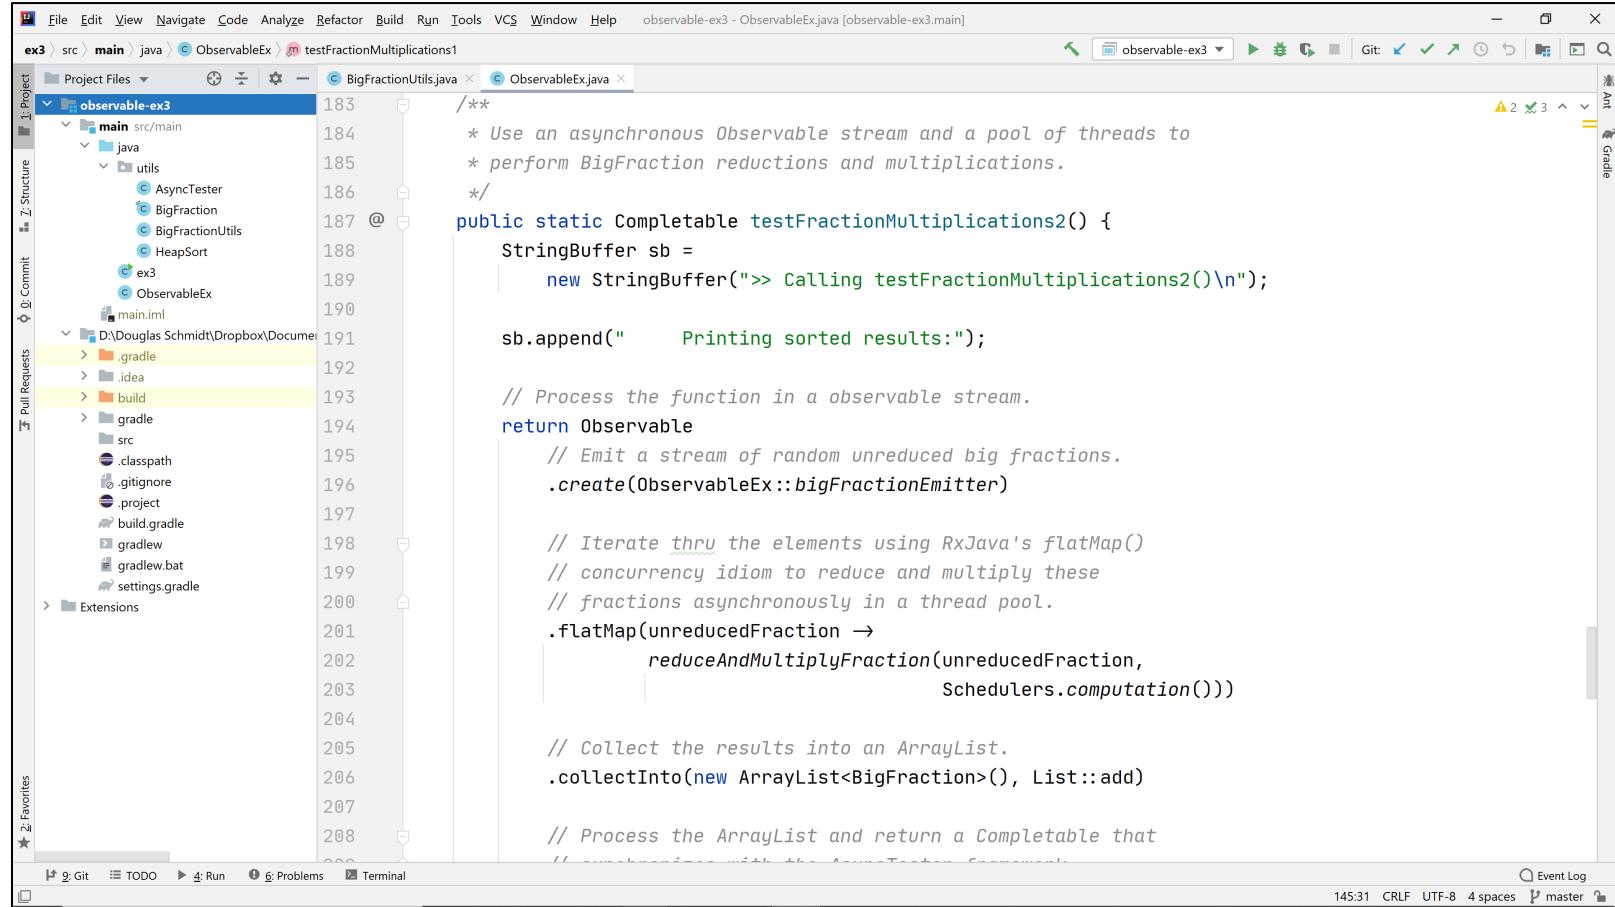

Learning Objectives in this Part of the Lesson

- Part 1 of case study ex3 shows how to use RxJava Observable operators flatMap(), fromArray(), fromIterable(), onErrorReturn(), fromCallable(), collect(), onErrorResumeNext(), reduce(), filter(), subscribeOn(), map(), & Schedulers.computation() to asynchronously create, multiply, & display BigFraction objects, even in the presence of errors
 - It also shows how Single operators doOnSuccess(), ignoreElement(), flatMapCompletable(), & just() can be used with Observable operators

```
return Single  
    .just(list)  
  
.doOnSuccess(displayList)  
  
.ignoreElement();
```

Applying Key Operators in the Observable Class to ex3

Applying Key Operators in the Observable Class to ex3

The screenshot shows the IntelliJ IDEA interface with the project 'observable-ex3' open. The code editor displays `ObservableEx.java`, which contains Java code using RxJava's Observable class. The code implements a function to perform asynchronous reductions and multiplications on a stream of BigFraction objects.

```
183     /**
184      * Use an asynchronous Observable stream and a pool of threads to
185      * perform BigFraction reductions and multiplications.
186     */
187    @Test
188    public static Completable testFractionMultiplications2() {
189      StringBuffer sb =
190        new StringBuffer(">> Calling testFractionMultiplications2()\n");
191
192      sb.append("      Printing sorted results:");
193
194      // Process the function in a observable stream.
195      return Observable
196        // Emit a stream of random unreduced big fractions.
197        .create(ObservableEx::bigFractionEmitter)
198
199        // Iterate thru the elements using RxJava's flatMap()
200        // concurrency idiom to reduce and multiply these
201        // fractions asynchronously in a thread pool.
202        .flatMap(unreducedFraction ->
203          reduceAndMultiplyFraction(unreducedFraction,
204            Schedulers.computation()))
205
206        // Collect the results into an ArrayList.
207        .collectInto(new ArrayList<BigFraction>(), List::add)
208
209        // Process the ArrayList and return a Completable that
210        // emits the final result back to the Observable stream.
```
