Learning Objectives in this Part of the Lesson

- Recognize the key methods in the ForkJoinPool class
- Recognize the key methods in the ForkJoinTask class

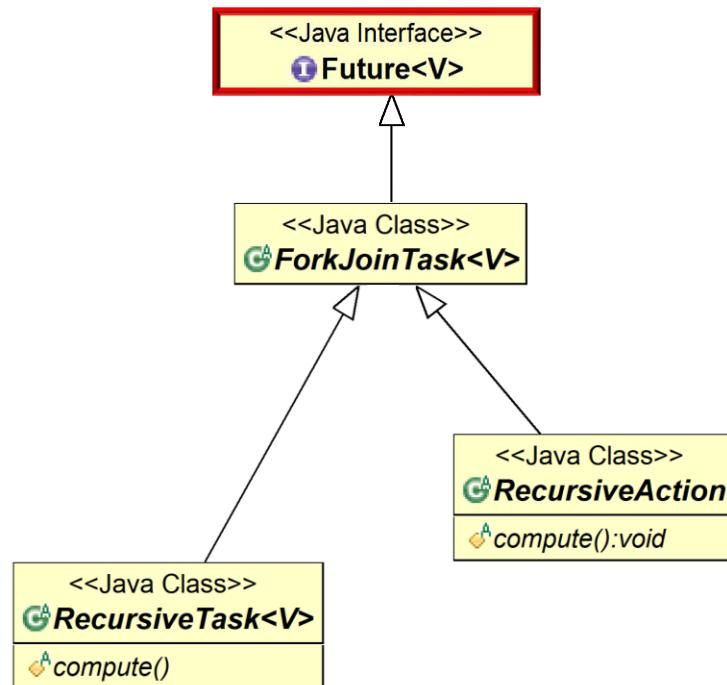

Key Methods in Java ForkJoinTask

Key Methods in Java ForkJoinTask

- ForkJoinTask implements Future

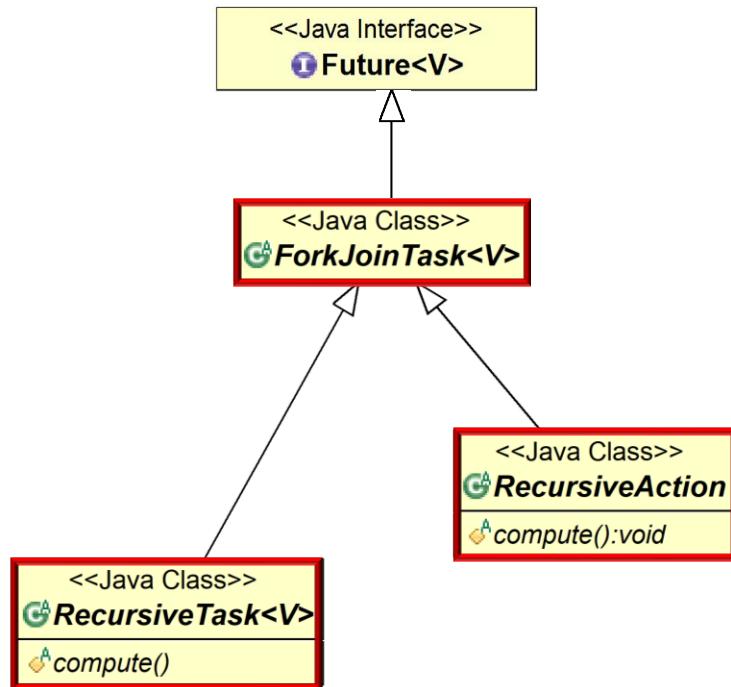

```
abstract class ForkJoinTask<V>
    implements Future<V>,
    Serializable {
```

Key Methods in Java ForkJoinTask

- ForkJoinTask implements Future

```
abstract class ForkJoinTask<V>  
    implements Future<V>,  
    Serializable {  
    ...  
}
```

It's uncommon to use these future methods, but rather use subclass methods

Key Methods in Java ForkJoinTask

- There are three key methods
 - `fork()` enables a task to create sub-tasks that run in parallel

```
abstract class ForkJoinTask<V>
    implements Future<V>,
    Serializable {
    ...
    final ForkJoinTask<V> fork()
    { ... }

    final V join() { ... }

    final V invoke() { ... }
```

Key Methods in Java ForkJoinTask

- There are three key methods
 - `fork()` enables a task to create sub-tasks that run in parallel
 - Arrange to execute this task asynchronously in the current task's pool or ForkJoinPool's common pool

```
abstract class ForkJoinTask<V>
    implements Future<V>,
    Serializable {
    ...
    final ForkJoinTask<V> fork()
    { ... }

    final V join() { ... }

    final V invoke() { ... }
```

Key Methods in Java ForkJoinTask

- There are three key methods

    Serializable {
    ...
    final ForkJoinTask<V> fork()
    { ... }

    final V join() { ... }

    final V invoke() { ... }
```

The fork() method does not block the caller

Key Methods in Java ForkJoinTask

- There are three key methods
 - `fork()` enables a task to create sub-tasks that run in parallel
 - Arrange to execute this task asynchronously in the current task's pool or `ForkJoinPool`'s common pool
 - Pushes the task on the head of the deque owned by the current worker thread

Key Methods in Java ForkJoinTask

- There are three key methods
 - `fork()` enables a task to create sub-tasks that run in parallel
 - `join()` returns the result of a previously fork'd computation when it's done

```
abstract class ForkJoinTask<V>
    implements Future<V>,
    Serializable {
    ...
    final ForkJoinTask<V> fork()
    { ... }

    final V join() { ... }

    final V invoke() { ... }
```

Key Methods in Java ForkJoinTask

- There are three key methods
 - `fork()` enables a task to create sub-tasks that run in parallel
 - `join()` returns the result of a previously fork'd computation when it's done
 - Calling task is “blocked” until forked sub-task is done

```
abstract class ForkJoinTask<V>
    implements Future<V>,
    Serializable {
    ...
    final ForkJoinTask<V> fork()
    { ... }

    final V join() { ... }

    final V invoke() { ... }
```

    Serializable {
    ...
    final ForkJoinTask<V> fork()
    { ... }

    final V join() { ... }

    final V invoke() { ... }
```

Key Methods in Java ForkJoinTask

- There are three key methods
 - `fork()` enables a task to create sub-tasks that run in parallel
 - `join()` returns the result of a previously fork'd computation when it's done
 - Calling task is “blocked” until forked sub-task is done
 - Defines a synchronization point

```
abstract class ForkJoinTask<V>
    implements Future<V>,
    Serializable {
    ...
    final ForkJoinTask<V> fork()
    { ... }

    final V join() { ... }

    final V invoke() { ... }
```

Key Methods in Java ForkJoinTask

- There are three key methods

- `fork()` enables a task to create sub-tasks that run in parallel

- `join()` returns the result of a previously fork'd computation when it's done

- Calling task is “blocked” until forked sub-task is done

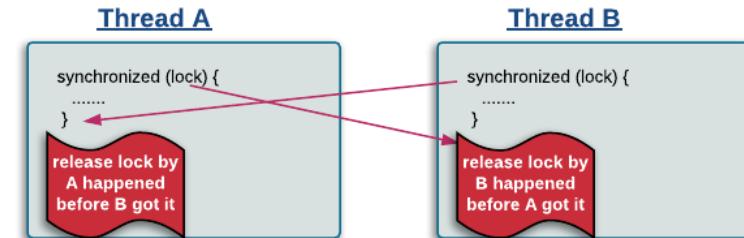

- Defines a synchronization point

- Ensures all writes in a worker thread that “happen-before” `join()` are made visible to other threads after the `join()`

```
abstract class ForkJoinTask<V>
    implements Future<V>,
    Serializable {
    ...
    final ForkJoinTask<V> fork()
    { ... }

    final V join() { ... }

    final V invoke() { ... }
```

Key Methods in Java ForkJoinTask

- There are three key methods
 - `fork()` enables a task to create sub-tasks that run in parallel
 - `join()` returns the result of a previously fork'd computation when it's done
 - `invoke()` performs this task, awaits its completion if needed, & returns its result

```
abstract class ForkJoinTask<V>
    implements Future<V>,
    Serializable {
    ...
    final ForkJoinTask<V> fork()
    { ... }

    final V join() { ... }

    final V invoke() { ... }
```

Key Methods in Java ForkJoinTask

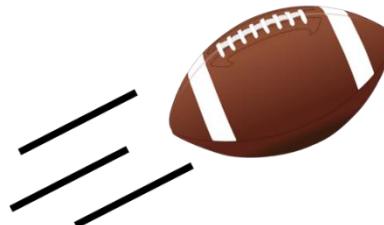

- There are three key methods

- fork() enables a task to create sub-tasks that run in parallel
- join() returns the result of a previously fork'd computation when it's done
- invoke() performs this task, awaits its completion if needed, & returns its result
 - Throws RuntimeException or Error if the underlying computation did so

```
abstract class ForkJoinTask<V>
    implements Future<V>,
    Serializable {
    ...
    final ForkJoinTask<V> fork()
    { ... }

    final V join() { ... }

    final V invoke() { ... }
```
