### **Java ExecutorService: Related Interfaces**

#### Douglas C. Schmidt <u>d.schmidt@vanderbilt.edu</u> www.dre.vanderbilt.edu/~schmidt

**Professor of Computer Science** 

Institute for Software Integrated Systems

Vanderbilt University Nashville, Tennessee, USA

#### Learning Objectives in this Part of the Lesson

- Recognize the powerful features defined in the Java ExecutorService interface
- Understand other interfaces related to ExecutorService

<<Java Interface>>

① Future<V>

cancel(boolean):booleanisCancelled():boolean

isDone():boolean

get()

get(long,TimeUnit)

<<Java Interface>>

① Callable<V>

call()

#### Interface ExecutorService

All Superinterfaces:

Executor

All Known Subinterfaces: ScheduledExecutorService

All Known Implementing Classes:

AbstractExecutorService, ForkJoinPool, ScheduledThreadPoolExecutor, ThreadPoolExecutor

#### public interface ExecutorService extends Executor

An Executor that provides methods to manage termination and methods that can produce a Future for tracking progress of one or more asynchronous tasks.

An ExecutorService can be shut down, which will cause it to reject new tasks. Two different methods are provided for shutting down an ExecutorService. The shutdown() method will allow previously submitted tasks to execute before terminating, while the shutdownNow() method prevents waiting tasks from starting and attempts to stop currently executing tasks. Upon termination, an executor has no tasks actively executing, no tasks awaiting execution, and no new tasks can be submitted. An unused ExecutorService should be shut down to allow reclamation of its resources.

ExecutorService uses several other interfaces to manage task lifecycles

<<Java Interface>>

- cancel(boolean):boolean
- isCancelled():boolean
- isDone():boolean
- get()
- get(long,TimeUnit)

< <java interface="">&gt;</java>
🖸 Runnable
run():void

< <java interface="">&gt;</java>
Callable <v></v>
● call()

ExecutorService uses two interfaces to define tasks

< <java interface="">&gt;  ① Callable<v></v></java>
⊜ call()

- ExecutorService uses two interfaces to define tasks, e.g.
  - Runnable
    - A "one-way" task that does not return a result

Runnable is a functional interface

See docs.oracle.com/javase/8/docs/api/java/lang/Runnable.html

- ExecutorService uses two interfaces to define tasks, e.g.
  - Runnable
  - Callable
    - A "two-way" task that returns a result

<<Java Interface>>

Callable<V>
call()

Callable is also a functional interface

See <a href="https://docs/api/java/util/concurrent/Callable.html">docs.oracle.com/javase/8/docs/api/java/util/concurrent/Callable.html</a>

- ExecutorService uses two interfaces to define tasks, e.g.
  Runnable
  - Callable
    - A "two-way" task that returns a result
    - Typically used to run two-way async tasks

<<Java Interface>>

- ExecutorService uses two interfaces to define tasks, e.g.
  - Runnable
  - Callable

Client

چ<

- A "two-way" task that returns a result
- Typically used to run two-way async tasks

method 1

method 2

Component

interface

• Implements the Active Object pattern

method\_2

execute

**Objectified request** 

Decouples the thread that invokes a method from the thread that executes the method

**Client thread** 

See <a href="mailto:en.wikipedia.org/wiki/Active\_object">en.wikipedia.org/wiki/Active\_object</a>

execute

service

request

Objectified

• ExecutorService uses the **Future** interface to represent & control a task's lifecycle

<<Java Interface>>

cancel(boolean):boolean

- isCancelled():boolean
- isDone():boolean

get()

get(long,TimeUnit)

See <a href="https://docs/api/java/util/concurrent/Future.html">docs.oracle.com/javase/8/docs/api/java/util/concurrent/Future.html</a>

- ExecutorService uses the **Future** interface to represent & control a task's lifecycle, e.g.,
  - Can be used to retrieve a two-way task's result

- ExecutorService uses the **Future** interface to represent & control a task's lifecycle, e.g.,
  - Can be used to retrieve a two-way task's result
  - Can be tested for completion

- ExecutorService uses the Future interface to represent & control a task's lifecycle, e.g.,
  - Can be used to retrieve a two-way task's result
  - Can be tested for completion
  - Can be tested for cancellation & cancelled

• A Java future defines a proxy to represent & control the result of an async computation.

See <a href="mailto:en.wikipedia.org/wiki/Futures\_and\_promises">en.wikipedia.org/wiki/Futures\_and\_promises</a>

• A Java future defines a proxy to represent & control the result of an async computation.

See <a href="https://www.citygrafx.com/table-numbers-table-markers">www.citygrafx.com/table-numbers-table-markers</a>

• A Java future defines a proxy to represent & control the result of an async computation.

e.g., McDonald's vs Wendy's model of preparing fast food

• ExecutorService.submit() can initiate an async computation in Java.

See next part of this lesson on "Java ExecutorService: Key Methods"

• ExecutorService.submit() can initiate an async computation in Java.

• ExecutorService.submit() can initiate an async computation in Java.

• ExecutorService.submit() can initiate an async computation in Java.

See upcoming part of this lesson on "Overview of Java ThreadPoolExecutor"

When the async computation completes the future is triggered & the result is available
 2. Return future
 ExecutorService

See www.nurkiewicz.com/2013/02/javautilconcurrentfuture-basics.html

When the async computation completes the future is triggered & the result is available
 2. Return future
 ExecutorService

See <u>docs.oracle.com/javase/8/docs/api/java/util/concurrent/Future.html#get</u>

- When the async computation completes the future is triggered & the result is available
   CALLER
   CALLEE
  - get() can block or (timed-)poll
  - Results can occur in a different order than the original calls were made

See <a href="mailto:en.wikipedia.org/wiki/Active\_object">en.wikipedia.org/wiki/Active\_object</a>

Other variants of Future are applied by implementations of the ExecutorService

- Other variants of Future are applied by implementations of the ExecutorService, e.g.
  - FutureTask
    - Conveys result from thread running a task to thread(s) retrieving result

See docs.oracle.com/javase/8/docs/api/java/util/concurrent/FutureTask.html

- Other variants of Future are applied by implementations of the ExecutorService, e.g.
  - FutureTask

#### RunnableFuture

 Execution of run() method will complete the future & allow access to its results

See <a href="https://docs.oracle.com/javase/8/docs/api/java/util/concurrent/RunnableFuture.html">https://docs/api/java/util/concurrent/RunnableFuture.html</a>

 A CompletableFuture is an implementation of Future that supports dependent actions triggered upon an async operation completion

*CompletableFuture isn't part of the Java Executor framework* 

CompletableFuture() SupplyAsync(Supplier<U>):CompletableFuture<U> SupplyAsync(Supplier<U>,Executor):CompletableFuture<U> SrunAsync(Runnable):CompletableFuture<Void> SrunAsync(Runnable,Executor):CompletableFuture<Void> CompletedFuture(U):CompletableFuture<U> isDone():boolean get() get(long,TimeUnit) join() complete(T):boolean thenApply(Function<?>):CompletableFuture<U> thenAccept(Consumer<? super T>):CompletableFuture<Void> o thenCombine(CompletionStage<? extends U>,BiFunction<?>):CompletableFuture<V> thenCompose(Function<?>):CompletableFuture<U> whenComplete(BiConsumer<?>):CompletableFuture<T> SallOf(CompletableFuture[]<?>):CompletableFuture<Void> SanyOf(CompletableFuture[]<?>):CompletableFuture<Object> isCancelled():boolean

See <a href="https://docs.oracle.com/javase/8/docs/api/java/util/concurrent/CompletableFuture.html">docs.oracle.com/javase/8/docs/api/java/util/concurrent/CompletableFuture.html</a>

- A CompletableFuture is an implementation of Future that supports dependent actions triggered upon an async operation completion
   SemultableFuture
  - This topic is covered elsewhere

CompletableFuture() SupplyAsync(Supplier <u>):CompletableFuture<u> SupplyAsync(Supplier<u>,Executor):CompletableFuture<u> runAsync(Runnable):CompletableFuture<void> runAsync(Runnable,Executor):CompletableFuture<void> completedFuture(U):CompletableFuture<u> isDone():boolean get() get(long,TimeUnit) join() complete(T):boolean</u></void></void></u></u></u></u>	< <java class="">&gt;  Generational CompletableFuture<t></t></java>
<ul> <li>thenApply(Function<? >):CompletableFuture<u></u></li> <li>thenAccept(Consumer<? super T>):CompletableFuture<void></void></li> <li>thenCombine(CompletionStage<? extends U>,BiFunction<? >):CompletableFuture<v></v></li> <li>thenCompose(Function<? >):CompletableFuture<u></u></li> <li>whenComplete(BiConsumer<? >):CompletableFuture<t></t></li> <li>allOf(CompletableFuture[]<? >):CompletableFuture<void></void></li> <li>anyOf(CompletableFuture[]<? >):CompletableFuture<object></object></li> <li>isCancelled():boolean</li> </ul>	<pre>     CompletableFuture()         SupplyAsync(Supplier<u>):CompletableFuture<u>         SupplyAsync(Supplier<u>).Executor):CompletableFuture<u>         SupplyAsync(Runnable):CompletableFuture<void>         SrunAsync(Runnable):CompletableFuture<void>         SrunAsync(Runnable,Executor):CompletableFuture<void>         SrunAsync(Runnable,Executor):CompletableFuture<void>         SompletedFuture(U):CompletableFuture<u>         isDone():boolean         get()         get(long,TimeUnit)         join()         complete(T):boolean         thenApply(Function<?>):CompletableFuture<u>         thenAccept(Consumer<? super T>):CompletableFuture<void>         thenCombine(CompletionStage<? extends U>,BiFunction<?>):CompletableFuture<v>         thenCompose(Function<?>):CompletableFuture<u>         whenComplete(BiConsumer<?>):CompletableFuture<t>         SallOf(CompletableFuture]<?>):CompletableFuture<void>         sanyOf(CompletableFuture]<?>):CompletableFuture<object>         isCancelled():boolean </object></void></t></u></v></void></u></u></void></void></void></void></u></u></u></u></pre>

#### See www.dre.vanderbilt.edu/~schmidt/DigitalLearning

• ExecutorService also forms the basis for key Java Executor framework subclasses

#### See <a href="mailto:src/share/classes/java/util/concurrent">src/share/classes/java/util/concurrent</a>

# End of Java Executor Service: Related Interfaces
