

Overview of Java Threads

(Part 2)

Douglas C. Schmidt

d.schmidt@vanderbilt.edu

www.dre.vanderbilt.edu/~schmidt

**Institute for Software
Integrated Systems
Vanderbilt University
Nashville, Tennessee, USA**

Learning Objectives in this Part of the Lesson

- Understand how Java threads support concurrency
- Learn how our case study app works
- Know alternative ways of giving code to a thread
- Learn how to pass parameters to a Java thread
- Know how to run a Java thread

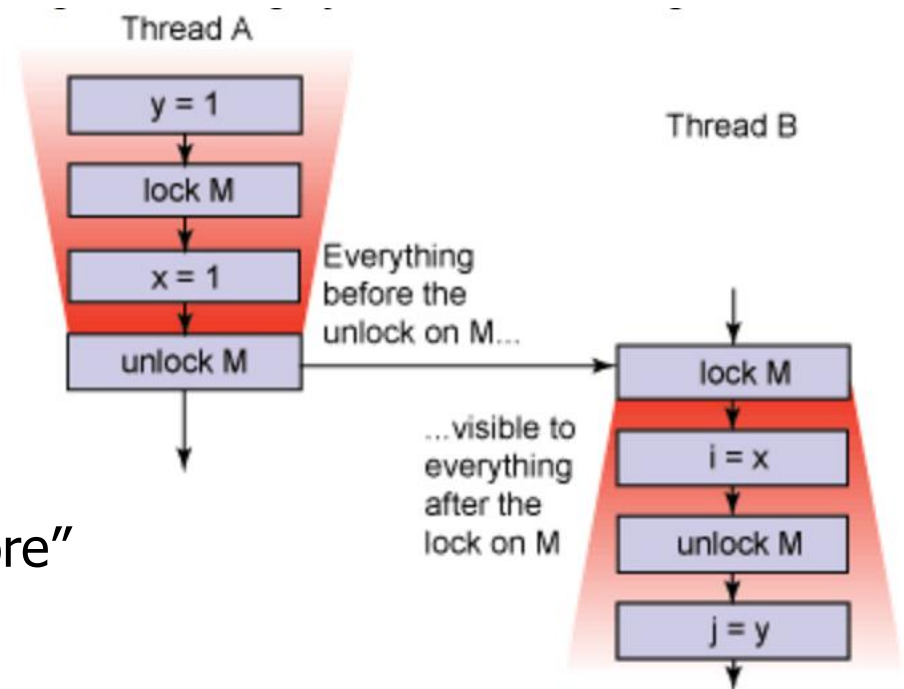

Learning Objectives in this Part of the Lesson

- Understand how Java threads support concurrency
- Learn how our case study app works
- Know alternative ways of giving code to a thread
- Learn how to pass parameters to a Java thread
- Know how to run a Java thread
- Recognize common thread methods

<<Java Class>>	
G Thread	
S	yield():void
S	currentThread():Thread
S	sleep(long):void
S	sleep(long,int):void
C	Thread()
C	Thread(Runnable)
C	Thread(String)
	start():void
	run():void
	exit():void
	interrupt():void
S	interrupted():boolean
	isInterrupted():boolean
F	isAlive():boolean
F	setPriority(int):void
F	getPriority():int
F	join(long):void
F	join(long,int):void
F	join():void
F	setDaemon(boolean):void
F	isDaemon():boolean

Learning Objectives in this Part of the Lesson

- Understand how Java threads support concurrency
- Learn how our case study app works
- Know alternative ways of giving code to a thread
- Learn how to pass parameters to a Java thread
- Know how to run a Java thread
- Recognize common thread methods
- Appreciate Java thread “happens-before” orderings

Running Java Threads

Running Java Threads

- There are multiple layers involved in creating & starting a thread

: My
Component

: MyThread

See Part 2 of the upcoming lesson on
"Managing the Java Thread Lifecycle"

Running Java Threads

- There are multiple layers involved in creating & starting a thread
- Creating a new thread object doesn't allocate a run-time call stack of activation records

See en.wikipedia.org/wiki/Call_stack

Running Java Threads

- There are multiple layers involved in creating & starting a thread
 - Creating a new thread object doesn't allocate a run-time call stack of activation records
- The runtime stack & other thread resources are only allocated after the `start()` method is called

Running Java Threads

- There are multiple layers involved in creating & starting a thread
 - Creating a new thread object doesn't allocate a run-time call stack of activation records
 - The runtime stack & other thread resources are only allocated after the `start()` method is called
 - The Java execution environment calls a thread's `run()` hook method after `start()` creates its resources

See wiki.c2.com/?HookMethod

Running Java Threads

- There are multiple layers involved in creating & starting a thread
 - Creating a new thread object doesn't allocate a run-time call stack of activation records
 - The runtime stack & other thread resources are only allocated after the `start()` method is called
 - The Java execution environment calls a thread's `run()` hook method after `start()` creates its resources
 - Each thread can run concurrently & block independently

Running Java Threads

- Any code can generally run in a thread

Running Java Threads

- Any code can generally run in a thread
- However, windowing toolkits often restrict which thread can access GUI components

Running Java Threads

- Any code can generally run in a thread
- However, windowing toolkits often restrict which thread can access GUI components
- e.g., only the Android UI thread can access GUI components

See developer.android.com/training/multiple-threads/communicate-ui.html

Running Java Threads

- A thread can live as long as its run() hook method hasn't returned

: My
Component

: MyThread

Running Java Threads

- A thread can live as long as its run() hook method hasn't returned
- The underlying thread scheduler can suspend & resume a thread many times during its lifecycle

See [en.wikipedia.org/wiki/Scheduling_\(computing\)](https://en.wikipedia.org/wiki/Scheduling_(computing))

Running Java Threads

- A thread can live as long as its run() hook method hasn't returned
- The underlying thread scheduler can suspend & resume a thread many times during its lifecycle
- Scheduler operations are largely invisible to user code, as long as synchronization is performed properly..

Running Java Threads

- For a thread to execute “forever,” its run() hook method needs an infinite loop

```
public void run(){  
    while (true) { ... }  
}
```

: My
Component

: MyThread

Running Java Threads

- The thread is dead after run() returns

Running Java Threads

- The thread is dead after run() returns
 - A thread can end normally

Running Java Threads

- The thread is dead after run() returns
 - A thread can end normally
 - Or an uncaught exception can be thrown

```
public void run(){  
    while (true) {  
        ...  
        throw new  
            SomeException();  
    }  
}
```

Running Java Threads

- The `join()` method allows one thread to wait for another thread to complete

: My
Component

: MyThread

Running Java Threads

- The `join()` method allows one thread to wait for another thread to complete

Simple form of "barrier synchronization"

See upcoming lessons on
"Java Barrier Synchronizers"

Running Java Threads

- The `join()` method allows one thread to wait for another thread to complete
- Or a thread can simply evaporate!

Running Java Threads

- The `join()` method allows one thread to wait for another thread to complete
 - Or a thread can simply evaporate!
- The Java execution environment recycles thread resources

Running Java Threads

- The `join()` method allows one thread to wait for another thread to complete
 - Or a thread can simply evaporate!
- The Java execution environment recycles thread resources
 - e.g., runtime stack of activation records, thread-specific storage, etc.

Some Common Java Thread Methods

Some Common Java Thread Methods

- There are a number of commonly used methods in the Java Thread class

<<Java Class>>

Thread

-  yield():void
-  currentThread():Thread
-  sleep(long):void
-  sleep(long,int):void
-  Thread()
-  Thread(Runnable)
-  Thread(String)
-  start():void
-  run():void
-  exit():void
-  interrupt():void
-  interrupted():boolean
-  isInterrupted():boolean
-  isAlive():boolean
-  setPriority(int):void
-  getPriority():int
-  join(long):void
-  join(long,int):void
-  join():void
-  setDaemon(boolean):void
-  isDaemon():boolean

See docs.oracle.com/javase/8/docs/api/java/lang/Thread.html

Some Common Java Thread Methods

- There are a number of commonly used methods in the Java Thread class, e.g.,
 - `void setDaemon()`
 - Marks thread as a “daemon”

<<Java Class>>

 **Thread**

-  `yield():void`
-  `currentThread():Thread`
-  `sleep(long):void`
-  `sleep(long,int):void`
-  `Thread()`
-  `Thread(Runnable)`
-  `Thread(String)`
-  `start():void`
-  `run():void`
-  `exit():void`
-  `interrupt():void`
-  `interrupted():boolean`
-  `isInterrupted():boolean`
-  `isAlive():boolean`
-  `setPriority(int):void`
-  `getPriority():int`
-  `join(long):void`
-  `join(long,int):void`
-  `join():void`
-  `setDaemon(boolean):void`
-  `isDaemon():boolean`

See javarevisited.blogspot.com/2012/03/what-is-daemon-thread-in-java-and.html

Some Common Java Thread Methods

- There are a number of commonly used methods in the Java Thread class, e.g.,
 - `void setDaemon()`
 - `void start()`
 - Allocates thread resources & initiates thread execution by calling the `run()` hook method

<<Java Class>>	
G Thread	
S	<code>yield():void</code>
S	<code>currentThread():Thread</code>
S	<code>sleep(long):void</code>
S	<code>sleep(long,int):void</code>
C	<code>Thread()</code>
C	<code>Thread(Runnable)</code>
C	<code>Thread(String)</code>
	<code>start():void</code>
	<code>run():void</code>
■	<code>exit():void</code>
	<code>interrupt():void</code>
S	<code>interrupted():boolean</code>
	<code>isInterrupted():boolean</code>
F	<code>isAlive():boolean</code>
F	<code>setPriority(int):void</code>
F	<code>getPriority():int</code>
F	<code>join(long):void</code>
F	<code>join(long,int):void</code>
F	<code>join():void</code>
F	<code>setDaemon(boolean):void</code>
F	<code>isDaemon():boolean</code>

Some Common Java Thread Methods

- There are a number of commonly used methods in the Java Thread class, e.g.,
 - `void setDaemon()`
 - `void start()`
 - `void run()`
 - Hook method where user code is supplied

<<Java Class>>	
G Thread	
S	<code>yield():void</code>
S	<code>currentThread():Thread</code>
S	<code>sleep(long):void</code>
S	<code>sleep(long,int):void</code>
C	<code>Thread()</code>
C	<code>Thread(Runnable)</code>
C	<code>Thread(String)</code>
	<code>start():void</code>
	<code>run():void</code>
■	<code>exit():void</code>
	<code>interrupt():void</code>

F	<code>join(long):void</code>
F	<code>join(long,int):void</code>
F	<code>join():void</code>
F	<code>setDaemon(boolean):void</code>
F	<code>isDaemon():boolean</code>

A simple form of "barrier synchronization"

Some Common Java Thread Methods

- There are a number of commonly used methods in the Java Thread class, e.g.,
 - `void setDaemon()`
 - `void start()`
 - `void run()`
 - `void join()`
 - `void sleep(long time)`
 - Sleeps for given time in ms

<<Java Class>>	
G Thread	
S	<code>yield():void</code>
S	<code>currentThread():Thread</code>
S	<code>sleep(long):void</code>
S	<code>sleep(long,int):void</code>
C	<code>Thread()</code>
C	<code>Thread(Runnable)</code>
C	<code>Thread(String)</code>
	<code>start():void</code>
	<code>run():void</code>
■	<code>exit():void</code>
	<code>interrupt():void</code>

	<code>isInterrupted():boolean</code>
F	<code>isAlive():boolean</code>
F	<code>setPriority(int):void</code>
F	<code>getPriority():int</code>
F	<code>join(long):void</code>
F	<code>join(long,int):void</code>
F	<code>join():void</code>
F	<code>setDaemon(boolean):void</code>
F	<code>isDaemon():boolean</code>

Some Common Java Thread Methods

- There are a number of commonly used methods in the Java Thread class, e.g.,
 - `void setDaemon()`
 - `void start()`
 - `void run()`
 - `void join()`
 - `void sleep(long time)`
 - **`Thread currentThread()`**
 - Object for current Thread

<<Java Class>>

Thread

-  `yield():void`
-  `currentThread():Thread`
-  `sleep(long):void`
-  `sleep(long,int):void`
-  `Thread()`
-  `Thread(Runnable)`
-  `Thread(String)`
-  `start():void`
-  `run():void`
-  `exit():void`
-  `interrupt():void`
-  `interrupted():boolean`
-  `isInterrupted():boolean`
-  `isAlive():boolean`
-  `setPriority(int):void`
-  `getPriority():int`
-  `join(long):void`
-  `join(long,int):void`
-  `join():void`
-  `setDaemon(boolean):void`
-  `isDaemon():boolean`

Some Common Java Thread Methods

- There are a number of commonly used methods in the Java Thread class, e.g.,
 - `void setDaemon()`
 - `void start()`
 - `void run()`
 - `void join()`
 - `void sleep(long time)`
 - `Thread currentThread()`
 - **`void interrupt()`**
 - Post an interrupt request to a Thread

<<Java Class>>

Thread

-  `yield():void`
-  `currentThread():Thread`
-  `sleep(long):void`
-  `sleep(long,int):void`
-  `Thread()`
-  `Thread(Runnable)`
-  `Thread(String)`
-  `start():void`
-  `run():void`
-  `exit():void`
-  `interrupt():void`
-  `interrupted():boolean`
-  `isInterrupted():boolean`
-  `isAlive():boolean`
-  `setPriority(int):void`
-  `getPriority():int`
-  `join(long):void`
-  `join(long,int):void`
-  `join():void`
-  `setDaemon(boolean):void`
-  `isDaemon():boolean`

See part 3 of upcoming lesson on
"Managing the Java Thread Lifecycle"

Some Common Java Thread Methods

- There are a number of commonly used methods in the Java Thread class, e.g.,
 - `void setDaemon()`
 - `void start()`
 - `void run()`
 - `void join()`
 - `void sleep(long time)`
 - `Thread currentThread()`
 - `void interrupt()`
 - **`boolean isInterrupted()`**
 - Tests whether a thread has been interrupted

<<Java Class>>

 **Thread**

-  `yield():void`
-  `currentThread():Thread`
-  `sleep(long):void`
-  `sleep(long,int):void`
-  `Thread()`
-  `Thread(Runnable)`
-  `Thread(String)`
-  `start():void`
-  `run():void`
-  `exit():void`
-  `interrupt():void`
-  `interrupted():boolean`
-  `isInterrupted():boolean`
-  `isAlive():boolean`
-  `setPriority(int):void`
-  `getPriority():int`
-  `join(long):void`
-  `join(long,int):void`
-  `join():void`
-  `setDaemon(boolean):void`
-  `isDaemon():boolean`

`isInterrupted()` can be called multiple times
w/out affecting the *interrupted status*

Some Common Java Thread Methods

- There are a number of commonly used methods in the Java Thread class, e.g.,
 - `void setDaemon()`
 - `void start()`
 - `void run()`
 - `void join()`
 - `void sleep(long time)`
 - `Thread currentThread()`
 - `void interrupt()`
 - `boolean isInterrupted()`
 - **`boolean interrupted()`**
 - Tests whether current thread has been interrupted

<<Java Class>>	
G Thread	
S	<code>yield():void</code>
S	<code>currentThread():Thread</code>
S	<code>sleep(long):void</code>
S	<code>sleep(long,int):void</code>
C	<code>Thread()</code>
C	<code>Thread(Runnable)</code>
C	<code>Thread(String)</code>
	<code>start():void</code>
	<code>run():void</code>
■	<code>exit():void</code>
	<code>interrupt():void</code>
S	<code>interrupted():boolean</code>
	<code>isInterrupted():boolean</code>
F	<code>isAlive():boolean</code>
F	<code>setPriority(int):void</code>
F	<code>getPriority():int</code>
F	<code>join(long):void</code>
F	<code>join(long,int):void</code>
F	<code>join():void</code>
F	<code>setDaemon(boolean):void</code>
F	<code>isDaemon():boolean</code>

`interrupted()` clears the *interrupted status* the first time it's called

Some Common Java Thread Methods

- There are a number of commonly used methods in the Java Thread class, e.g.,
 - `void setDaemon()`
 - `void start()`
 - `void run()`
 - `void join()`
 - `void sleep(long time)`
 - `Thread currentThread()`
 - `void interrupt()`
 - `boolean isInterrupted()`
 - `boolean interrupted()`
 - `void setPriority(int newPriority)`
& `int getPriority()`
 - Set & get the priority of a Thread

<<Java Class>>

 **Thread**

-  `yield():void`
-  `currentThread():Thread`
-  `sleep(long):void`
-  `sleep(long,int):void`
-  `Thread()`
-  `Thread(Runnable)`
-  `Thread(String)`
-  `start():void`
-  `run():void`
-  `exit():void`
-  `interrupt():void`
-  `interrupted():boolean`
-  `isInterrupted():boolean`
-  `isAlive():boolean`
-  `setPriority(int):void`
-  `getPriority():int`
-  `join(long):void`
-  `join(long,int):void`
-  `join():void`
-  `setDaemon(boolean):void`
-  `isDaemon():boolean`

Java Thread “Happens-Before” Orderings

Java Thread "Happens-Before" Orderings

- Java Threads methods establish "happens-before" orderings

<<Java Class>>

Thread

- `yield():void`
- `currentThread():Thread`
- `sleep(long):void`
- `sleep(long,int):void`
- `Thread()`
- `Thread(Runnable)`
- `Thread(String)`
- `start():void`
- `run():void`
- `exit():void`
- `interrupt():void`
- `interrupted():boolean`
- `isInterrupted():boolean`
- `isAlive():boolean`
- `setPriority(int):void`
- `getPriority():int`
- `join(long):void`
- `join(long,int):void`
- `join():void`
- `setDaemon(boolean):void`
- `isDaemon():boolean`

See en.wikipedia.org/wiki/Happened-before

Java Thread "Happens-Before" Orderings

- Java Threads methods establish "happens-before" orderings
 - Ensure that if one event "happens before" another event, the result must reflect that, even if those events are actually executed out of order

<<Java Class>>	
G Thread	
S	<code>yield():void</code>
S	<code>currentThread():Thread</code>
S	<code>sleep(long):void</code>
S	<code>sleep(long,int):void</code>
C	<code>Thread()</code>
C	<code>Thread(Runnable)</code>
C	<code>Thread(String)</code>
	<code>start():void</code>
	<code>run():void</code>
	<code>exit():void</code>
	<code>interrupt():void</code>
S	<code>interrupted():boolean</code>
	<code>isInterrupted():boolean</code>
F	<code>isAlive():boolean</code>
F	<code>setPriority(int):void</code>
F	<code>getPriority():int</code>
F	<code>join(long):void</code>
F	<code>join(long,int):void</code>
F	<code>join():void</code>
F	<code>setDaemon(boolean):void</code>
F	<code>isDaemon():boolean</code>

See en.wikipedia.org/wiki/Happened-before

Java Thread "Happens-Before" Orderings

- Java Threads methods establish "happens-before" orderings
 - Ensure that if one event "happens before" another event, the result must reflect that, even if those events are actually executed out of order
 - e.g., to optimize program flow & concurrency

<<Java Class>>	
G Thread	
● ^S	<code>yield():void</code>
● ^S	<code>currentThread():Thread</code>
● ^S	<code>sleep(long):void</code>
● ^S	<code>sleep(long,int):void</code>
● ^C	<code>Thread()</code>
● ^C	<code>Thread(Runnable)</code>
● ^C	<code>Thread(String)</code>

● ^F	<code>isDaemon():boolean</code>

Java Thread "Happens-Before" Orderings

- Java Threads methods establish "happens-before" orderings
 - Ensure that if one event "happens before" another event, the result must reflect that, even if those events are actually executed out of order
 - In general, a happens-before relationship guarantees that memory written to by statement *A* is visible to statement *B*

<<Java Class>>	
G Thread	
S	yield():void
S	currentThread():Thread
S	sleep(long):void
S	sleep(long,int):void
C	Thread()
C	Thread(Runnable)

F	join(long,int):void
F	join():void
F	setDaemon(boolean):void
F	isDaemon():boolean

See en.wikipedia.org/wiki/Java_memory_model

Java Thread "Happens-Before" Orderings

- Examples of "happens-before" orderings in Java
 - Starting a thread "happens-before" the run() hook method of the thread is called

```
Thread t1 =  
    new Thread(() ->  
                System.out.println  
                ("hello world"))  
        .start();
```

<<Java Class>>	
G Thread	
S	yield():void
S	currentThread():Thread
S	sleep(long):void
S	sleep(long,int):void
C	Thread()
C	Thread(Runnable)
C	Thread(String)
	start():void
	run():void
■	exit():void
	interrupt():void
S	interrupted():boolean
	isInterrupted():boolean
F	isAlive():boolean
F	setPriority(int):void
F	getPriority():int
F	join(long):void
F	join(long,int):void
F	join():void
F	setDaemon(boolean):void
F	isDaemon():boolean

Java Thread "Happens-Before" Orderings

- Examples of "happens-before" orderings in Java
 - Starting a thread "happens-before" the run() hook method of the thread is called, e.g.

```
Thread t1 =  
    new Thread(() ->  
                System.out.println  
                  ("hello world"))  
        .start();
```

*This lambda plays
the role of the run()
hook method!*

<<Java Class>>	
G Thread	
S	yield():void
S	currentThread():Thread
S	sleep(long):void
S	sleep(long,int):void
C	Thread()
C	Thread(Runnable)
C	Thread(String)
	start():void
	run():void
■	exit():void
	interrupt():void
S	interrupted():boolean
	isInterrupted():boolean
F	isAlive():boolean
F	setPriority(int):void
F	getPriority():int
F	join(long):void
F	join(long,int):void
F	join():void
F	setDaemon(boolean):void
F	isDaemon():boolean

Java Thread "Happens-Before" Orderings

- Examples of "happens-before" orderings in Java
 - Starting a thread "happens-before" the run() hook method of the thread is called, e.g.

```
Thread t1 =  
    new Thread( () ->  
                System.out.println  
                ("hello world"))  
    .start();
```

*A thread's state is
consistent & visible
before run() starts*

<<Java Class>>	
G Thread

See docs.oracle.com/javase/8/docs/api/java/util/concurrent/package-summary.html

Java Thread "Happens-Before" Orderings

- Examples of "happens-before" orderings in Java
 - Starting a thread "happens-before" the run() hook method of the thread is called
 - Methods in java.util.concurrent package classes also establish "happen-before" orderings, e.g.

```
// Thread t1
ConcurrentMap concurrentMap =
    new ConcurrentHashMap();
concurrentMap.put("key", "value");

// Thread t2
Object value = concurrentMap.get("key");
```

Placing an object into a concurrent collection happens-before the access or removal of the element from the collection

<<Java Class>>

	run():void
■	exit():void
	interrupt():void
S	interrupted():boolean
	isInterrupted():boolean
F	isAlive():boolean
F	setPriority(int):void
F	getPriority():int
F	join(long):void
F	join(long,int):void
F	join():void
F	setDaemon(boolean):void
F	isDaemon():boolean

Java Thread "Happens-Before" Orderings

- Examples of "happens-before" orderings in Java
 - Starting a thread "happens-before" the run() hook method of the thread is called
 - Methods in java.util.concurrent package classes also establish "happen-before" orderings
 - The termination of a thread "happens-before" a join() with the terminated thread

```
Thread t1 =  
    new Thread(() ->  
        System.out.println  
            ("hello world"))  
        .start();  
  
t1.join();
```

<<Java Class>>	
G Thread	
S	yield():void
S	currentThread():Thread
S	sleep(long):void
S	sleep(long,int):void
C	Thread()
C	Thread(Runnable)
C	Thread(String)
	start():void
	run():void
■	exit():void
	interrupt():void
S	interrupted():boolean
	isInterrupted():boolean
F	isAlive():boolean
F	setPriority(int):void
F	getPriority():int
F	join(long):void
F	join(long,int):void
F	join():void
F	setDaemon(boolean):void
F	isDaemon():boolean

Java Thread "Happens-Before" Orderings

- Examples of "happens-before" orderings in Java
 - Starting a thread "happens-before" the run() hook method of the thread is called
 - Methods in java.util.concurrent package classes also establish "happen-before" orderings
 - The termination of a thread "happens-before" a join() with the terminated thread, e.g.

```
Thread t1 =  
    new Thread(() ->  
        System.out.println  
            ("hello world"))  
        .start();  
  
t1.join();
```

This thread terminates after its lambda expression runnable completes

<<Java Class>>

Thread

- ^Syield():void
- ^ScurrentThread():Thread
- ^Ssleep(long):void
- ^Ssleep(long,int):void
- ^CThread()
- ^CThread(Runnable)
- ^CThread(String)
- start():void
- run():void
- exit():void
- interrupt():void
- ^Sinterrupted():boolean
- isInterrupted():boolean
- ^FisAlive():boolean
- ^FsetPriority(int):void
- ^FgetPriority():int
- ^Fjoin(long):void
- ^Fjoin(long,int):void
- ^Fjoin():void
- ^FsetDaemon(boolean):void
- ^FisDaemon():boolean

Java Thread "Happens-Before" Orderings

- Examples of "happens-before" orderings in Java
 - Starting a thread "happens-before" the run() hook method of the thread is called
 - Methods in java.util.concurrent package classes also establish "happen-before" orderings
 - The termination of a thread "happens-before" a join() with the terminated thread, e.g.

```
Thread t1 =  
    new Thread(() ->  
        System.out.println  
            ("hello world"))  
        .start();  
  
t1.join();
```

A thread waiting on a (non-timed) join() only resumes after the target thread terminates

<<Java Class>>	
G Thread	
S	yield():void
S	currentThread():Thread
S	sleep(long):void
S	sleep(long,int):void
C	Thread()
C	Thread(Runnable)
C	Thread(String)
	start():void
	run():void
■	exit():void

S	interrupted():boolean
	isInterrupted():boolean
F	isAlive():boolean
F	setPriority(int):void
F	getPriority():int
F	join(long):void
F	join(long,int):void
F	join():void
F	setDaemon(boolean):void
F	isDaemon():boolean

Java Thread “Happens-Before” Orderings

- The implementations of these Java thread & library classes are responsible for ensuring that these “happens-before” orderings are preserved

You don't need to understand all the nitty-gritty details of Java's memory model – you just need to understand how to use synchronizers properly!

End of Overview of Java Threads (Part 2)

Discussion Questions

1. Which of the following are correct statements about the key differences between the Java Thread `start()` & `run()` methods?
 - a. The `start()` method sets the priority of the thread & the `run()` method allocates the thread's resources*
 - b. The `start()` method allocates the thread's resources & dispatches the `join()` method, which implements user-supplied code*
 - c. The `start()` method allocates the thread's resources & dispatches the `run()` method, which implements user-supplied code*
 - d. The `start()` method allocates the thread's resources & dispatches the `run()` method, which implements barrier synchronization*
